Bui Duc Huy

Blockchain Engineer · Technical Leader · Ethereum clients

Ho Chi Minh City, Viet Nam · duchuy.124dk@gmail.com · imduchuyyy.github.io · github.com/imduchuyyy · x.com/imduchuyyy

SUMMARY

Blockchain engineer with 5+ years of experience, working mostly on Ethereum-based clients and protocols. Core contributor to the Viction clients, forks of go-ethereum and Erigon, covering consensus, transaction pool and gas sponsorship logic. Technical Leader at Ninety Eight, where the team shipped Saros ($50M+ TVL, ~$1B volume) and Dagora. Works in Go, Rust and Solidity.

EXPERIENCE

Technical Leader · **Ninety Eight, Viet Nam** — Dec 2023 – Present

- Lead the engineering team designing and shipping on-chain protocols on Solana and EVM.
- **Viction** (EVM Layer 1): core contributor to the node clients. In vic-geth (go-ethereum fork), implemented VRC-25 fee payment, Viction txpool rules, hardfork config and p2p fixes. In vic-erigon (Erigon fork), brought up PoSV consensus. In the legacy client, introduced the VRC-25 gas sponsorship standard and fixed a fee refund bug.
- **Vicscan** (Viction block explorer): built the Rust backend, covering the block indexer pipeline, event bus, token and NFT indexing, and market data jobs.
- **Saros** (liquidity layer on Solana): designed and built the core AMM protocol and partner SDK. Grew to $50M+ TVL and ~$1B trading volume.
- **Dagora** (multichain NFT marketplace): designed and built the core protocol. Reached multi-million trading volume and ran ~200 launchpads.
- **Eternals Game** (gaming on Viction): built the core protocol.

Blockchain Engineer · **Ninety Eight, Viet Nam** — Nov 2021 – Dec 2023

- **OneID** (multichain name service): built and maintained the core protocol.
- **Baryon** (multichain DeFi suite): built and maintained the AMM and staking protocols.

Blockchain Engineer Intern · **Vietnam Blockchain Corporation** — Aug 2020 – Nov 2021

Frontend Engineer Intern · **Acexis** — Nov 2019 – Aug 2020

SELECTED OPEN SOURCE

- **vic-geth** – go-ethereum fork for Viction: VRC-25 fees, txpool, hardforks.
- **vic-erigon** – Erigon fork for Viction: PoSV consensus and genesis support.
- **victionchain #535, #542** – VRC-25 upgrade and a fee refund fix (merged).
- **fystack/multichain-indexer #33** – cut memory allocations in the Tron indexer (merged).
- **shmcache** – cross-process key/value cache in Rust over POSIX shared memory.
- **tinybook** – order book matching engine in Rust, written from scratch.
- **agentcanpay** – Rust CLI that gives an AI agent its own crypto wallet.
- **querypro** – terminal UI for backend stacks, Go core with gRPC plugins.
- **multicall-proxy** – upgradeable (UUPS) multicall contract built with Foundry.
- **openpass-eth** – ERC-4337 wallet with passkey signers and social recovery.
- **saros-swap #5, #10** – swap-exact-out support for the Saros AMM on Solana (merged).
- **confidential-transaction** – confidential transactions on Ethereum using zk-SNARKs.

SKILLS

Languages: Go, Rust, Solidity, TypeScript
Ethereum: go-ethereum, Erigon, EVM, consensus, txpool, p2p, ERC-4337, Foundry
Other: blockchain indexers, Tokio, Solana programs, AMM design, zk-SNARKs
Leadership: technical leadership, protocol design

EDUCATION

Ho Chi Minh City University of Technology – Bachelor of Engineering in Computer Science
